## PrivacySafe helps people to **monetize their communities.**

PrivacySafe Community Payments lets people and groups charge directly for access to private communities, conversations, and exclusive content. A podcaster can charge listeners to join a members-only secure zone. An artist can give paying fans early access to music or artwork. A consultant can charge for a private meeting. A celebrity or influencer can put a price on video chats.

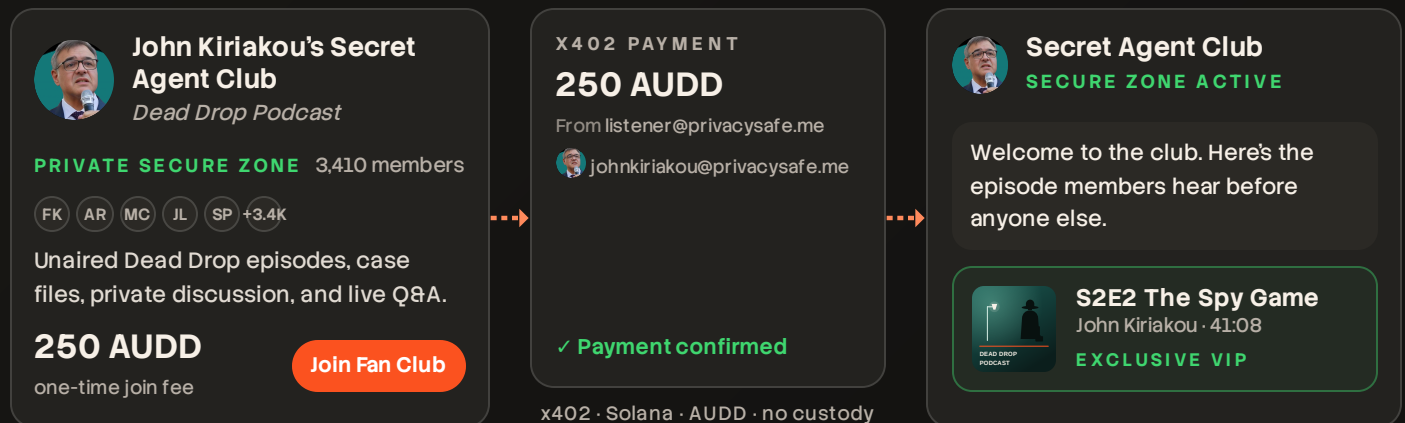

### PAYMENT RAIL

Payments use x402 as the payment mechanism, with AUDD transferred on Solana directly to the recipient's verified wallet. PrivacySafe never takes custody.

### EXAMPLE

#### John Kiriakou's **Secret Agent Club**

John Kiriakou hosts the *Dead Drop Podcast*. Inside PrivacySafe, he can create **John Kiriakou's Secret Agent Club**, a private secure zone offering unaired episodes, case files, private discussion, and live Q&A.

A listener sees the membership price before joining: **250 AUDD**. The listener pays through the x402 flow and 250 AUDD moves on Solana directly to John Kiriakou. PrivacySafe verifies the payment and unlocks the Secret Agent Club community. John can immediately share an episode that members hear before anyone else.

The same model works for artist "Georgia Peach" who is releasing an exclusive song to a paid fan club. Or any consultant charging for their services, or a celebrity charging strangers who want to meet them.

## Pay the identity. **Unlock the community.**

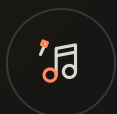

PrivacySafe already gives people persistent identities for encrypted conversations, private groups, contacts, files, and other sensitive information.

The plan is simple:

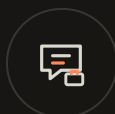

The last crypto cycle used NFTs and Discord roles to create exclusive communities. PrivacySafe takes the shorter path: **pay the person or group directly and get access inside a secure zone.**

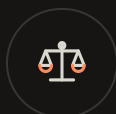

The same payment gate can also be the default setting for any user, so that they can charge a small fee for trusted contacts and ignore strangers while making it difficult for them to be spammed.

## WHY PRIVACYSAFE

### We built the private community layer **first.**

PrivacySafe is a suite of secure communication and file sharing apps. It includes encrypted messaging, private contacts, secure storage, exclusive groups, video calls, and user-controlled identities. PrivacySafe is currently shipping on Android, Mac OS, Windows, GNU/Linux, and soon iOS.

The work accomplished during the hackathon adds:

- Solana linked identities;
- QR-based identity sharing and invites;
- paid group and first-contact requests in Chat;
- x402 payment mechanism;
- AUDD settlement on Solana.

PrivacySafe is commercialized by Ivy Cyber with 100% of the source code available. PrivacySafe Foundation, a separate 501(c)(3) nonprofit, develops shared ecosystem code and carries out educational and public-interest work.

### | Solana gives our communities a **direct payment pipeline.**
